Matter To The Deepest
Ustroń
September 2015

Goals of Loopedia

- Public database of loop integrals
- Community involvement (desired) for input
- Result of integral and reference
- Easy search (properties, categories, ...)

First Version of Loopedia

The first (current) version of the Loopedia website can be found at:
<http://www.mpp.mpg.de/~papara/loopediatest>

- Input:
 - Nickel Index
or
 - Adjacency List
- Output: Generated Graph (with Neato and GraphState)

Construction of the Nickel Index

Nickel Index: $e12| e2| e|$

- Number the vertices starting with zero
- Nodes that have connection with zeroth vertex
- Nodes that have connection with first node (without already established connections)
- ...

Try all vertex numberings \rightarrow minimal **Nickel Index**
More details in [Batkovich et al. (arXiv:1409.8227)]

Construction of the Nickel Index

Nickel Index: $e12| e2| e|$

- Number the vertices starting with zero
- Nodes that have connection with zeroth vertex
- Nodes that have connection with first node (without already established connections)
- ...

Try all vertex numberings \rightarrow minimal **Nickel Index**
More details in [Batkovich et al. (arXiv:1409.8227)]

Construction of the Adjacency List

Adjacency List:

"[-1, 0], [0, 1], [0, 2], [-1, 1], [1, 2], [2, -1]"

Rules:

- Number vertices with non-negative integers
- List all connections (lines)
- External connections (external legs) are **all** denoted with "-1"

Further Examples

Nickel: $e12|34|35|6|e6|e6||$

Adjacency list:

$[-1, 1], [1, 2], [1, 4], [2, 3], [3, 4],$
 $[4, 6], [3, 5], [2, 7], [6, -1], [6, 5],$
 $[5, 7], [7, -1]$

Nickel: $e111|e|$

Adjacency list:

$[-1, 1], [1, 2], [1, 2], [1, 2], [2, -1]$

Adjacency List

An adjacency list is a list of connections between vertices. Please label the vertices after a non-negative integers (0, 1, 3, 23, ...). And **all** external legs are labelled with the **same** "-1". Please **don't** use "-2", "-3" and so on.

An example of an adjacency list would be "[-1, 1], [1, 2], [1, 2], [1, 2], [2, -1]" for the Sunrise diagram.

Nickel Index

A Nickel Index is a string consisting of several parts. For **each** vertex there exists one part which *must* be closed with a vertical bar "|". The vertices are numbered the programmer's style: the first one gets the number zero (0) and so on. So the first part of the nickel index lists the vertices that are connected to the first (0) vertex – external connections are denoted with "e". The second part lists all connections of the second (1) vertex except the previous established connections with the first vertex. This goes on. In each part only new connections (lines) are written down such that in the whole nickel string every line is denoted by exactly one character (number or "e").

Now by permuting the vertex numbers one can find a particular "minimal" index. This is called the (true) Nickel Index. This Nickel Index is explained in more detail in the paper of [Batkovich et al.](#) As an example the Nickel Index of the sunrise diagram would be "e111|e".

As another example consider the following Nickel index: "e123|e23|e3||". This diagram has four vertices. Thus there are four parts in the Nickel index closed off with a vertical bar | including the last one, which contains no new connections.

Choose if you want to provide a Nickel Index or an Adjacency List

Nickel Index

Adjacency List

Adjacency List

[-1, 1], [1, 2],[1, 3], [2, 4], [3, 4], [2, 5], [4, 5], [3, 5], [5, -1]

Correspondung Nickel Index: "e12|34|34|e4||"

Conclusion

Summary

- Unique identifier of a graph: Nickel Index
- First version of Loopedia: Graph generation and transformation between Nickel Index and Adjacency List

Outlook

- Set up integral submission system

Thank you!
