Search for charged lepton flavour violation

many New Physics models predicts lepton flavour violation process to occur with much higher probability than SM

- SM branching ratios are unobservable Typically SM (BR< 10<sup>-40</sup>), SUSY (BR∼ 10<sup>-11</sup> − 10<sup>-15</sup>)
- In many models there is a relation between LFV and dipole moments.

▲□▶▲□▶▲□▶▲□▶ □ ● ●

 Any signal observed may help to understand flavour structure of SM Rare muon decays Robert Szafron

### Motivation

 $\iota \rightarrow e \gamma$ 

 $\mu - e$  conversion

- Flavour transitions in neutral sector is observed
- Ongoing effort in measuring possible Charged Lepton Flavour Violation (CLFV)

History of 
$$\mu \to e\gamma$$
,  $\mu N \to eN$ , and  $\mu \to 3e$ 

### Rare muon decays Robert Szafron

Motivation

 $\iota \rightarrow e\gamma$ 

 $\mu - e$  conversion

Outlook and conclusions

[R. Bernstein, P. Cooper arXiv:1307.5787]

・ロット (雪) (日) (日) (日)

MEG experiment at Paul Scherrer Institute is looking for  $\mu \rightarrow e\gamma$ 

Upgrade in progress (Construction 2015, Data taking 2016 - 2018)

- ▶ present limit 5.7 × 10<sup>-13</sup> [MEG Collaboration, Phys. Rev. Lett. 110, 201801 (2013)]
- expected limit  $6 \times 10^{-14}$

Signal and background:

Signal – two body decay: back to back monoenergetic  $e\gamma$ ,

$$E_e = E_\gamma = \frac{m_\mu}{2}$$

(日)

### Rare muon decays

Robert Szafron

**Aotivation** 

 $\mu \to e \gamma$ 

 $\mu - e$  conversion

# Background

- Accidental background dominant, determined by detector resolution
- Radiative muon decay (RMD)

Rare muon decays Robert Szafron

Motivation

 $\mu \rightarrow e\gamma$ 

 $\mu - e$  conversion

Ongoing work – improvment in evaluation of the background – electron and photon distribution in RMD with A. Czarnecki, Y. Liang, K. Melnikov Rare muon decays Robert Szafron

 $\mu \rightarrow e\gamma$

Experiment **Mu2e** at Fermilab: Construction may begin in 2015, commissioning in 2019 and initial preliminary results may be ready about 2020.

Rare muon decays

Robert Szafron

 $\mu - e$ 

Experiment measures rate of coherent muon to electron conversion on nucleus normalized to all nuclear captures

$$R_{\mu e} = \frac{\Gamma[\mu + (A,Z) \rightarrow e + (A,Z)]}{\Gamma[\mu + (A,Z) \rightarrow \nu_{\mu} + (A,Z-1)]}$$

Present limit:  $R_{\mu e} < 7 \cdot 10^{-13}$ 

Expected sensitivity  $R_{\mu e} \sim 10^{-17}$ 

This study are complementary to the LHC and can probe New Physics scale up to **10,000** TeV If New Physics is found CLFV can help discriminate models

### Rare muon decays Robert Szafron

Motivation

 $\mu \to e^{i}$ 

 $\mu - e$  conversion

# Signal and background

### Rare muon decays Robert Szafron

# Signal and background

### Rare muon decays Robert Szafron

# Signal and background

Rare muon decays Robert Szafron Experimental signature - monoenergetic electron

$$E_{conv} = m_{\mu} - E_{bin} - E_{red}$$

Background - muon decay in orbit (DIO), tail of the spectrum

Most recent evaluation:

A. Czarnecki X. Garcia i Tormo, W. Marciano (2011)

- numerical solution of Dirac equation
- includes recoil and finite nucleus size effects
- no radiative corrections

Rare muon decays Robert Szafron

Motivation

 $\iota \rightarrow e$ 

 $\mu - e$ conversion

Outlook and conclusions

(日)

# Toy example: $\mu \rightarrow eJ$

Rare muon

decays

Expansion close to  $E_e \sim m_{\mu}$ .

$$\frac{m_{\mu}}{\Gamma_0} \frac{d\Gamma}{dE_e} \approx (Z\alpha)^5 (E_e - E_{max})^3 f(Z\alpha)$$

Function  $f(Z\alpha)$  can be expanded but corrections are large

$$f(Z\alpha) \approx \frac{512}{3\pi} - 160 Z\alpha + \frac{6064 + 473\pi^2 - 2944 \log(2) - 1536 \log(Z\alpha)}{9\pi} (Z\alpha)^2$$

Rare muon decays Robert Szafron

Motivation

 $\mu \rightarrow e$ 

 $\mu - e$ conversion

Outlook and conclusions

<□> < @> < @> < @> < @> < @> < @</p>

# Quasi-Classical approximation

# Rare muon<br/>decaysRobert SzafronMotivation $\mu \rightarrow e\gamma$ $\mu - e$ <br/>conversionOutlook and

Error  $\sim \frac{(Z\alpha)^2}{l^2}$  but region  $E_e \sim m_\mu$  dominated by low *l*.

$$l = r \times p \sim \frac{1}{m}m \sim 1$$

# Quasi-Classical approximation

### Rare muon decays Robert Szafron

Motivation

 $\mu \rightarrow e^{i}$ 

 $\mu - e$  conversion

Outlook and conclusions

Works better for  $E_e \sim \frac{m_{\mu}}{2}$ , region dominated by high values of *l*.

$$l = r \times p \sim \frac{1}{mZ\alpha} \frac{m}{2} \sim \frac{1}{Z\alpha}$$

# Outlook and conclusions

- Exciting time for discoveries at the intensity frontier
- Proper understanding of the background is crucial for obtaining expected accuracy of new experiments
- pQCD methods are used to improve background evaluation (shape function, fragmentation function, etc.)
- For Mu2e we need a theory that allows us to take into account
  - interaction of both muon and electron with the field of nucleus
  - finite size of nucleus
  - recoil effects
  - radiative corrections

Rare muon decays Robert Szafron

Next step: Radiative corrections

- vacuum polarization in the hard photon
- self energy correction
- real radiation

Final goal:

- Smooth matching of the electron spectrum in all energy regions
- Effective field theory description
