Neutrinos and Flavor Symmetries

Flavor symmetries, why?

· Using the diagonalization relation

$$m_{\nu} = U_0^{\star} \operatorname{diag}(m_1, m_2, m_3) U_0^{\dagger},$$

such a mixing matrices can easily diagonalize a $\mu - \tau$ symmetric (transformations $\nu_e \rightarrow \nu_e$, $\nu_\mu \rightarrow \nu_\tau$, $\nu_\tau \rightarrow \nu_\mu$ under which the neutrino mass term remains unchanged) neutrino mass matrix of the form

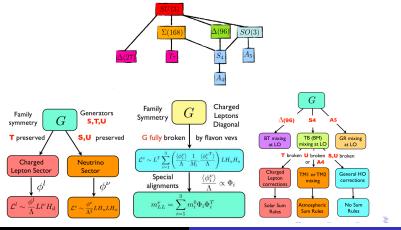

$$m_{\nu} = \left(\begin{array}{ccc} A & B & B \\ B & C & D \\ B & D & C \end{array}\right),$$

With A + B = C + D this matrix yields tribimaximal mixing pattern where $s_{12} = 1/\sqrt{3}$ i.e., $\theta_{12} = 35.26^{\circ}$

э

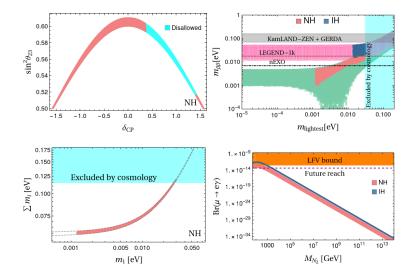

General Framework

- Fundamental symmetry in the lepton sector can easily explain the origin of neutrino mixing which is considerably different from quark mixing.
- Incidentally, both Abelian or non-Abelian family symmetries have potential to shade light on the Yukawa couplings.
- The Abelian symmetries (such as Froggatt-Nielsen symmetry) only points towards a hierarchical structure of the Yukawa couplings.
- Non-Abelian symmetries are more equipped to explain the non-hierarchical structures of the observed lepton mixing as observed by the oscillation experiments. S. F. King *et.al.* 1301.1340

Flavor Symmetries in Various Frontiers:

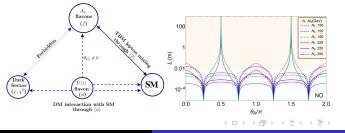

\Rightarrow Leptogenesis :

 The CP-violating out-of-equilibrium decay of RH neutrinos into lepton and Higgs doublets in the early universe produces a net lepton asymmetry
Fukugita, Yanagida, 1986; Covi, Roulet, Vissani 9605319

$$\begin{split} \epsilon_i^{\alpha} &= \frac{\Gamma(N_i \to \ell_{\alpha} H) - \Gamma(N_i \to \overline{\ell_{\alpha}} \overline{H})}{\Gamma(N_i \to \ell_{\alpha} H) + \Gamma(N_i \to \overline{\ell_{\alpha}} \overline{H})} = \frac{1}{8\pi} \sum_{j \neq i} \frac{\operatorname{Im} \left[\left((\hat{Y}_{\nu}^{\dagger} \hat{Y}_{\nu})_{ij} \right)^2 \right]}{(\hat{Y}_{\nu}^{\dagger} \hat{Y}_{\nu})_{ii}} f\left(\frac{m_i^2}{m_j^2} \right) \\ f(x) &= \sqrt{x} \left[\frac{2-x}{1-x} - (1-x) \ln \left(1 + \frac{1}{x} \right) \right] \text{ with } x = m_i^2 / m_j^2 \end{split}$$

 \Rightarrow Dark Matter, Collider Physics :

- Can we extend flavor symmetry to the dark sector as well?, Can discrete symmetry play any role to ensure the stability of dark matter?
- Eexperiments are sensitive to the low-energy CP phases connected with flavor symmetry

Biswajit Karmakar Neutrinos and Flavor Symmetries

- Is there any guiding principle behind observed pattern of lepton mixing ?
- (Discrete) flavor symmetry is one such potential candidate.
- What additional role they can play?
- How to falsify these plethora of models?
- If flavor symmetry is not the guiding principle, what else?
