Conference *Matter To The Deepest*

Katowice, Sep 18, 2025

Particle physics (I)

Fundamental questions

- What are we made of ?
- What are fundamental building blocks of matter and how they interact ?
- What is the origin and evolution of the Universe ?

Particle physics (I)

Fundamental questions

- What are we made of ?
- What are fundamental building blocks of matter and how they interact ?
- What is the origin and evolution of the Universe ?

Small scales

- Typical human hair has thickness of about 50 to 100 μm
($5 \cdot 10^{-5}\text{m}$ to 10^{-4}m)
- Size of an atom 10^{-10}m
→ one million times smaller

Particle physics

- Comparison: size of an atom 10^{-10}m
size of its core 10^{-15}m
- Universe its mostly empty

Particle physics

- Comparison: size of an atom 10^{-10}m
size of its core 10^{-15}m
- Universe its mostly empty
- Subatomic distances at 10^{-15}m and less

Standard Model of elementary particles

“Periodic table” of elementary particles

- **Quarks**
(constituents of matter)
- **Leptons**
(constituents of matter)
- **Gauge bosons**
(carriers of exchange forces)
- **Higgs boson**
(responsible for mass of elementary particles)

Three generations of matter (fermions)

	I	II	III	
Quarks	mass: 2.4 MeV/c ² charge: 2/3 spin: 1/2 u up	mass: 1.27 GeV/c ² charge: 2/3 spin: 1/2 c charm	mass: 173.2 GeV/c ² charge: 2/3 spin: 1/2 t top	mass: 1 GeV/c ² charge: 0 spin: 0 H Higgs boson
	mass: 4.5 MeV/c ² charge: -1/3 spin: 1/2 d down	mass: 104 MeV/c ² charge: -1/3 spin: 1/2 s strange	mass: 4.2 GeV/c ² charge: -1/3 spin: 1/2 b bottom	mass: 0 charge: 0 spin: 1 g gluon
Leptons	mass: <2.2 eV/c ² charge: 0 spin: 1/2 ν_e electron neutrino	mass: <0.17 MeV/c ² charge: 0 spin: 1/2 ν_μ muon neutrino	mass: <10.5 MeV/c ² charge: 0 spin: 1/2 ν_τ tau neutrino	mass: 81.2 GeV/c ² charge: 0 spin: 1 Z⁰ Z boson
	mass: 0.511 MeV/c ² charge: -1 spin: 1/2 e electron	mass: 105.7 MeV/c ² charge: -1 spin: 1/2 μ muon	mass: 1.777 GeV/c ² charge: -1 spin: 1/2 τ tau	mass: 80.4 GeV/c ² charge: ±1 spin: 1 W[±] W boson
				mass: 0 charge: 0 spin: 0 γ photon

Nobel prizes for particle discoveries

Particle	Discovery	Discoverer(s)	Nobel Prize(s)	Year
Electron (e^-)	1897	J.J. Thomson	J.J. Thomson	1906
Positron (e^+)	1932	C.D. Anderson	C.D. Anderson	1936
Neutron (n)	1932	J. Chadwick	J. Chadwick	1935
e -Neutrino (ν_e)	1956	C. Cowan, F. Reines	F. Reines	1995
Muon (μ^-)	1936	Anderson, Neddermeyer	–	–
Pion (π)	1947	C.F. Powell et al.	C.F. Powell	1950
Antiproton ($\bar{p}$)	1955	Segrè, Chamberlain	Segrè, Chamberlain	1959
μ -Neutrino (ν_μ)	1956	Schwartz & Steinberger	Schwartz & Steinberger	1988
Quark Structure	1968+	Friedman, Kendall, Taylor (SLAC)	Friedman, Kendall, Taylor	1990
Charm Quark (J/ψ)	1974	Ting, Richter	Ting, Richter	1976
Gluon (indirect)	1979	DESY (PETRA Experiment)	–	–
Tau Lepton (τ)	1975	M. Perl	Perl, Reines (shared)	1995
Bottom Quark (b)	1977	Lederman & collaborators	Lederman	1988
W and Z Bosons	1983	CERN (UA1, UA2)	Rubbia, van der Meer	1984
Top Quark (t)	1995	CDF, D0 (Fermilab)	–	–
Higgs Boson (H)	2012	CMS, ATLAS (CERN)	Englert, Higgs (theory)	2013

Nobel prize in physics 2013

*... for the theoretical discovery of **a mechanism that contributes to our understanding of the origin of mass of subatomic particles**, and which recently was confirmed through the discovery of the predicted fundamental particle, by the ATLAS and CMS experiments at CERN's Large Hadron Collider.*

Masses of elementary particles

- Mass of a gold atom (**Au**)

$$m_{\text{Au}} \approx 10^{-25} \text{ kg}$$

Particle	Mass (kg)	Ratio to Au
Top quark (<i>t</i>)	10^{-25}	1
Higgs boson (<i>H</i>)	10^{-25}	10^{-1}
Z boson (<i>Z</i>)	10^{-25}	10^{-1}
W boson (<i>W</i>)	10^{-25}	10^{-1}
Bottom quark (<i>b</i>)	10^{-26}	10^{-1}
Charm quark (<i>c</i>)	10^{-27}	10^{-2}
Tau lepton (τ^-)	10^{-27}	10^{-2}
Muon (μ^-)	10^{-28}	10^{-3}
Electron (e^-)	10^{-30}	10^{-5}
Up/Down quark (<i>u, d</i>)	10^{-30}	10^{-5}
Neutrinos (ν)	$< 10^{-36}$	$< 10^{-11}$

Classical scattering experiment

- In classical physics, no new particles are produced

High-energy colliders

Einstein relation

- $E = mc^2$

High-energy colliders

Einstein relation

- $E = mc^2$

It is a quantum world

- $E > mc^2$:
Anything that is allowed will happen
- $E < mc^2$: Anything that is forbidden can happen
for a short period of time according to
Heisenberg's Uncertainty Principle $\Delta E \Delta t \gtrsim \hbar$

The Large Hadron Collider

- Highest energies at colliders until 203x

Model of LHC

- Ring and experiments approximately 100m underground
 - ATLAS, CMS, Alice, LHCb

CMS experiment

CMS experiment

person

Particle interactions

- Production of Higgs bosons from other Standard Model particles according to $E = mc^2$

Higgs boson discovery

- Higgs boson H production at the LHC
 - fusion of two gluons (via top-quark loop) to Higgs boson
 - Higgs decay (via top-quark loop) to two photons

Higgs boson discovery

- Higgs boson H production at the LHC
 - fusion of two gluons (via top-quark loop) to Higgs boson
 - Higgs decay (via top-quark loop) to two photons

Higgs boson discovery

- Higgs boson H production at the LHC

Higgs boson discovery

Higgs boson discovery

Higgs event

- Candidate event $H \rightarrow ZZ \rightarrow e^+e^- \mu^+ \mu^-$

Real event

- Real event in a collision (pile-up , minimum bias, background, . . .)
 - fast triggers (hardware) for removal of pile-up, minimum bias etc.
 - deep neural networks (software) for signal and background separation
- Machine learning and artificial intelligence heavily used in physics analyses

Costs of a Higgs boson

Category	Estimated Cost (up to 2024)
Construction	EUR 4.6 billion
Operation	EUR 5.25 billion
Total	EUR10 billion

- Summary of LHC costs up to 2024 (approximate values)

LHC Run	Years	Higgs Bosons Produced (est.)
Run 1	2010–2012	0.2 million
Run 2	2015–2018	7 million
Run 3	2022–mid 2024	3.7 million
Total	2010–mid 2024	11 million

- Estimated Higgs boson production at the LHC up to mid-2024
- Each Higgs boson produced (2010–2024) now costs less than EUR 1000

Search for new heavy scalar bosons

- Heavy scalar boson Φ decaying to top quark pairs

CERN COURIER.COM

NEWS ANALYSIS

STRONG INTERACTIONS

CMS observes top–antitop excess

Excitement in the community

- CERN courier
edition May 2025

Experimental data

excess of data

- Invariant mass distribution of top-quark pairs

Top-quark production

- Top-quarks produced close to threshold $E \gtrsim mc^2$
- Slowly moving color charges r, g, b

- Exchange of (many) gluons between quark and anti-quark

Top-quark production

- Top-quarks produced close to threshold $E \gtrsim mc^2$
- Slowly moving color charges r, g, b

- Exchange of (many) gluons between quark and anti-quark

Electromagnetism

- Coloumb interaction of static charges

Top-quark bound state

Schrödinger equation

- Coulomb interaction from solution of Schrödinger equation

$$\left\{ -\frac{\vec{\nabla}^2}{m_t} + V_{\text{QCD}}(\vec{x}) - (E + i\Gamma_t) \right\} G(E, \vec{x}) = \delta^{(3)}(\vec{x})$$

Top-quark bound state

Schrödinger equation

- Coulomb interaction from solution of Schrödinger equation

$$\left\{ -\frac{\vec{\nabla}^2}{m_t} + V_{\text{QCD}}(\vec{x}) - (E + i\Gamma_t) \right\} G(E, \vec{x}) = \delta^{(3)}(\vec{x})$$

attractive interaction
(resonant enhancement)

Analysis of experimental data

- Left: background-only hypothesis
- Right: including top-quark bound state

Upshot

- No more deviations for low values of m_A mass

The future

Prediction is very difficult, especially if it is about the future

Future colliders

- FCC - Future Circular Collider
 - a new collider ring with 91 km circumference (in operation after 2045)
- Precision measurements of Higgs bosons, top-quarks, ...

Mass of the electron

- FCC-ee can check if electron mass m_e is indeed due to Higgs mechanism $e^+e^- \rightarrow H$

- Run a number of years at energy of Higgs boson mass
- Caveats
 - serious background $e^+e^- \rightarrow q\bar{q}$
 - experimentally very difficult

Atomic size

- We would understand the size of atoms!
 - Bohr radius (size of hydrogen atom) $a_0 = \frac{\hbar}{m_e c \alpha}$
 - Planck's constant $\hbar$
 - speed of light c
 - Fine structure constant (electron charge) α

FCC scope

- Scientific discovery: address fundamental questions in particle physics
- Technological innovation: advance cutting-edge technologies (e.g., superconductors, computing)
- Training and education: top-tier training of international talent
- Economic benefits: investment in high-tech industries (proven spin-offs into industry and society)
- International collaboration: reinforcement of Europe's leadership in global science

Parameters

- Total construction costs **15.320 MCHF** (incl. four experiments **1.300 MCHF**)
- Planned construction period 2033 - 2046
- Peak power during beam operations $\approx$ **300 MW**
- Total energy consumption $\approx$ **1.4 TWh/year**

Near future (I)

- Electron-Ion Collider

A machine that will unlock the secrets of the strongest force in Nature

Near future (II)

- Deep Underground Neutrino Experiment
An international flagship experiment to unlock the mysteries of neutrinos

DUNE @ LBNF

Near future (III)

- Vera C. Rubin Observatory
will bring the night sky to life and revolutionize the way we explore the cosmos

Rubin Observatory in Chile

Summary

State-of-the-art

- Particle physics revealed matter's fundamental components via Standard Model
- Notable successes include discovering the Higgs boson and precise measurements

Open questions

- Higgs boson interactions and potential
- Neutrino masses
- Imbalance between matter and antimatter
- Nature of dark matter

Future

- Future experiments and new technologies will address open questions
- Potential for groundbreaking discoveries that could fundamentally deepen understanding of Universe
